#### Appendix A. Ward identity for polarization operator in QED.

#### 1. Higgs mechanism in scalar QED by diagrams.

1.1. Gauge symmetry and massless photon.

Recall the QED Lagrangian

$$L_{QED} = -\frac{1}{4}F_{\mu\nu}(x)F^{\mu\nu}(x) + \bar{\psi}(i\partial_\mu\gamma^\mu - eA_\mu\gamma^\mu - m)\psi, \\ F_{\mu\nu}(x) = \partial_\mu A_\nu - \partial_\nu A_\mu \quad (1)$$

It is invariant under the gauge symmetry

$$A_\mu(x) \rightarrow A_\mu(x) + \frac{1}{e}\partial_\mu\alpha(x), \psi(x) \rightarrow \exp[i\alpha(x)]\psi(x) \quad (2)$$

We are interested in total propagator for gauge field

$$D_{\mu\nu}(k) = \langle \Omega | T A_\mu(k) A_\nu(-k) | \Omega \rangle = \\ D_{\mu\nu}^0(k) + D_{\mu\lambda}^0(k)P^{\lambda\sigma}(k)D_{\sigma\nu}^0(k) + D_{\mu\lambda}^0(k)P^{\lambda\sigma}(k)D_{\sigma\rho}^0(k)P^{\rho\tau}(k)D_{\tau\nu}^0(k) + \dots \quad (3)$$

which means the following sum of diagrams

$$\text{---} + \text{---} \bullet \text{---} + \text{---} \bullet \bullet \text{---} + \text{---} \bullet \bullet \bullet \text{---} + \dots = \text{---} \bullet \text{---} \quad (4)$$

where

$$D_{\mu\nu}^0(k) = \frac{-\imath}{k^2} \left( g_{\mu\nu} - \frac{k_\mu k_\nu}{k^2} \right) \equiv \frac{-\imath}{k^2} (g_\perp)_{\mu\nu} \quad (5)$$

is a free propagator and  $P^{\mu\nu}(k)$  is a polarization operator which is given by a sum of amputated diagrams which can not be divided by cutting one of internal lines. Ward identity (see Appendix A)

$$k_\mu P^{\mu\nu}(k) = 0 \quad (6)$$

and Lorentz invariance constraint

$$P^{\mu\nu}(k) = A(k^2)g^{\mu\nu} + B(k^2)k^\mu k^\nu \quad (7)$$

allow to write

$$P^{\mu\nu}(k) = \imath(k^2 g^{\mu\nu} - k^\mu k^\nu) p(k^2) = \imath k^2 g_\perp^{\mu\nu} p(k^2) \quad (8)$$

Then we can perform the summation in (??) and obtain

$$D_{\mu\nu}(k) = \frac{-\imath}{k^2} (g_\perp)_{\mu\nu} + \frac{-\imath}{k^2} (g_\perp)_{\mu\nu} p(k^2) + \frac{-\imath}{k^2} (g_\perp)_{\mu\nu} p^2(k^2) + \dots = \frac{-\imath (g_\perp)_{\mu\nu}}{k^2 (1 - p(k^2))} \quad (9)$$

where the relation

$$(g_\perp)_{\mu\nu} g^{\nu\lambda} (g_\perp)_{\lambda\rho} = (g_\perp)_{\mu\rho} \quad (10)$$

has been used.

We see that

**if  $p(k^2)$  is regular function at  $k^2 = 0$  the photon stay massless.**

Indeed, in the limit  $k^2 \rightarrow 0$

$$D_{\mu\nu}(k) \rightarrow \frac{-i(g_{\perp})_{\mu\nu}}{k^2} Z_3, \quad Z_3 = \frac{1}{1 - p(0)} \quad (11)$$

we have a massless photon with renormalized field strenght of  $A_{mu}(x)$ .

*1.2. EM field interacting with scalar field and Higgs effect.*

Let us consider the Lagrangian

$$\begin{aligned} L(A, \psi, \Phi) &= L_{EM} + |D_{\mu}\Phi|^2 + \mu^2\Phi^*\Phi - \frac{\lambda}{4}(\Phi^*\Phi)^2, \\ L_{EM} &= -\frac{1}{4}(F_{\mu\nu})^2, \quad D_{\mu} = \partial_{\mu} + ieA_{\mu} \end{aligned} \quad (12)$$

Under the gauge transformation we have

$$\begin{aligned} \Phi(x) &\rightarrow \exp[i\alpha(x)]\Phi(x), \quad \psi(x) \rightarrow \exp[i\alpha(x)]\psi(x), \\ A_{\mu}(x) &\rightarrow A_{\mu}(x) - \frac{1}{e}\partial_{\mu}\alpha(x) \end{aligned} \quad (13)$$

Let us expand the complex scalar field  $\Phi(x)$  around the minima  $\Phi_0 = \frac{\mu}{\sqrt{\lambda}}$  of its potential  $V(\Phi) = -\frac{\mu^2}{2}\Phi^*\Phi + \frac{\lambda}{4}(\Phi^*\Phi)^2$

$$\begin{aligned} \Phi(x) &= \Phi_0 + \frac{1}{\sqrt{2}}(\phi_1(x) + i\phi_2(x)), \\ V(\Phi) &= -\frac{\mu^4}{4\lambda} + \frac{\mu^2}{2}\phi_1^2 + O(\phi^3) \end{aligned} \quad (14)$$

Hence,  $\phi_1$  becomes massive while  $\phi_2$  is massless (Goldstone boson)

$$(m_1)^2 = \mu^2, \quad (m_2)^2 = 0 \quad (15)$$

Then we can write

$$\begin{aligned}
(D_\mu \Phi)^2 &= \left( \frac{1}{\sqrt{2}} \partial_\mu \phi + ie A_\mu \left( \Phi_0 + \frac{\phi}{\sqrt{2}} \right) \right) \left( \frac{1}{\sqrt{2}} \partial^\mu \phi^* - ie A_\mu \left( \Phi_0 + \frac{\phi}{\sqrt{2}} \right) \right) = \\
&\quad \frac{1}{2} \left( (\partial_\mu \phi_1)^2 + (\partial_\mu \phi_2)^2 \right) + e^2 \Phi_0^2 A_\mu A^\mu + \sqrt{2} e \Phi_0 A^\mu \partial_\mu \phi_2 + \\
&\quad e A^\mu (\phi_1 \partial_\mu \phi_2 - \phi_2 \partial_\mu \phi_1) + \sqrt{2} e^2 \phi_1 A_\mu A^\mu + \frac{e^2}{2} (\phi_1^2 + \phi_2^2) A_\mu A^\mu = \\
&\quad \frac{1}{2} \left( (\partial_\mu \phi_1)^2 + (\partial_\mu \phi_2)^2 \right) + e^2 \Phi_0^2 A_\mu A^\mu + \sqrt{2} e \Phi_0 A^\mu \partial_\mu \phi_2 + \dots \quad (16)
\end{aligned}$$

we see the mass term  $e^2 \Phi_0^2 A_\mu A^\mu$  appeared.

*1.3. Higgs effect leads to a pole in photon polarization operator and generates photon mass.*

Now we will demonstrate that due to the Godstone's boson exchange the gauge field  $A_\mu$  becomes massive because of the polarization operator get pole.

From the quadratic terms we can read off the diagrams represented on fig. 1.

Vector boson propagator:

$$\begin{array}{ccc}
& \frac{-i}{k^2} (g_\perp)_{\mu\nu} = & \\
m & \text{-----} & n
\end{array} \quad (17)$$

Mass term vertex for the vector boson:

$$\begin{array}{ccc}
& i \frac{m_A^2}{2} g_{\mu\nu} = & \\
m & \text{-----} \bullet \text{-----} & n
\end{array} \quad (18)$$

Goldstone's boson propagator:

$$\begin{array}{ccc}
& \frac{i}{k^2} = & \\
& \text{-----} & \\
& & (19)
\end{array}$$

Vector boson Goldstone's boson transition

$$\begin{aligned}
 k_\mu m_A &= i\sqrt{2}e\Phi_0(-ik_\mu) = \\
 &\quad \text{-----} \bullet \text{-----} \\
 -k_\mu m_A &= i\sqrt{2}e\Phi_0(ik_\mu) = \\
 &\quad \text{-----} \bullet \text{-----}
 \end{aligned}
 \tag{20}$$

The leading order contribution to the polarization operator for the vector boson is given by the Goldstone's boson exchange:

$$\begin{aligned}
 P^{\mu\nu}(k) &= im_A^2 g^{\mu\nu} - k^\mu m_A \frac{-i}{k^2} (-k^\nu m_A) = \\
 &im_A^2 \left( g^{\mu\nu} - \frac{k^\mu k^\nu}{k^2} \right) = im_A^2 g_\perp^{\mu\nu}
 \end{aligned}
 \tag{21}$$

which can be represented by the diagram on fig.2.:

$$\begin{aligned}
 P^{\mu\nu}(k) &= im_A^2 g_\perp^{\mu\nu} = \begin{array}{c} m \text{---} \bullet \text{---} n \\ \bullet \text{---} \bullet \end{array} = \\
 &m \text{-----} \bullet \text{-----} n + m \text{-----} \bullet \text{-----} n
 \end{aligned}
 \tag{22}$$

Notice that  $P^{\mu\nu}(k)$  is transverse and has a pole at  $k^2 = 0$ .

**Remark.**

There is also a contribution to  $P^{\mu\nu}(k)$  coming from the term  $eA^\mu(\phi_1\partial_\mu\phi_2 - \phi_2\partial_\mu\phi_1)$  (see (??)). But it is much less than the contribution from  $\sqrt{2}e\Phi_0 A^\mu\partial_\mu\phi_2$  term because  $\Phi_0 = \frac{\mu}{\sqrt{\lambda}}$  is bigger than the  $\lambda$ -perturbation theory series corrections.

One can sum up all the diagrams represented on fig.3. to obtain the

total propagator of the field  $A_\mu(x)$

$$\begin{aligned}
D_{\mu\nu}(k) &= \frac{-\imath}{k^2}(g_\perp)_{\mu\nu} + \frac{-\imath}{k^2}(g_\perp)_{\mu\lambda}P^{\lambda\sigma}(k)\frac{-\imath}{k^2}(g_\perp)_{\sigma\nu} + \\
&\frac{-\imath}{k^2}(g_\perp)_{\mu\lambda}P^{\lambda\sigma}(k)\frac{-\imath}{k^2}(g_\perp)_{\sigma\rho}P^{\rho\tau}(k)\frac{-\imath}{k^2}(g_\perp)_{\tau\nu} + \dots = \\
&\frac{-\imath}{k^2}(g_\perp)_{\mu\nu} + \frac{-\imath}{k^2}(g_\perp)_{\mu\nu}\frac{m_A^2}{k^2} + \frac{-\imath}{k^2}(g_\perp)_{\mu\nu}\frac{m_A^4}{k^4} + \dots = \\
&\frac{-\imath}{k^2}\frac{(g_\perp)_{\mu\nu}}{\left(1 - \frac{m_A^2}{k^2}\right)} = -\imath\frac{(g_\perp)_{\mu\nu}}{(k^2 - m_A^2)}
\end{aligned} \tag{23}$$

Thus we see that gauge field becomes massive. From the other hand we can write

$$D_{\mu\nu}(k) = \frac{-\imath}{k^2 - m_A^2}\left(g_{\mu\nu} - \frac{k_\mu k_\nu}{m_A^2}\right) + \frac{-\imath k_\mu k_\nu}{m_A^2 k^2} \tag{24}$$

The first term is a propagator for the vector field  $A_\mu(x)$  with the Lagrangian

$$-\frac{1}{4}F^2 - \frac{m_A^2}{2}A_\mu A^\mu \tag{25}$$

The equations of motion for  $A$ :

$$\partial^\mu F_{\mu\nu} + m_A^2 A_\nu = 0 \Rightarrow \partial^\nu A_\nu = 0 \Leftrightarrow k^\nu A_\nu(k) = 0 \tag{26}$$

Hence,  $A_\mu$  has transverse polarization but the Lagrangian (??) gives non-renormalizable theory because of the term  $\frac{k_\mu k_\nu}{m_A^2}$  in the propagator. Fortunately the last term from (??) cure the problem.

## 2. QED and Higgs effect in t'Hooft gauge fixing.

### 2.1. The Lagrangian and Higgs mechanism.

$$\begin{aligned}
L &= -\frac{1}{4}(F_{\mu\nu})^2 + |D_\mu\Phi|^2 - V(\Phi), \\
V(\Phi) &= -\mu^2\Phi^*\Phi + \frac{\lambda}{2}(\Phi^*\Phi)^2, \quad \Phi = \frac{1}{\sqrt{2}}(\Phi^1 + \imath\Phi^2) \\
D_\mu &= \partial_\mu + \imath e A_\mu
\end{aligned} \tag{27}$$

Gauge transformations are given by

$$\delta\Phi^1 = -\alpha(x)\Phi^2, \quad \delta\Phi^2 = \alpha(x)\Phi^1, \quad \delta A_\mu = -\frac{1}{e}\partial_\mu\alpha \quad (28)$$

One can expand the potential  $V(\Phi)$  around the vacuum:

$$\begin{aligned} \Phi_0 &= \frac{1}{\sqrt{2}}v = \sqrt{\frac{2}{\lambda}}\mu, \quad \frac{\partial V}{\partial\Phi^i}_{\Phi=\Phi_0} = 0, \\ \Phi(x) &= \Phi_0 + \frac{1}{\sqrt{2}}(h(x) + i\phi(x)), \\ V(h, \phi) &= -\frac{\mu^4}{2\lambda} + \mu^2 h^2(x) + \\ &\frac{\lambda}{8}(4vh^3(x) + h^4(x)) + \frac{\lambda}{4}(2vh(x) + h^2(x))\phi^2(x) + \frac{\lambda}{8}\phi^4(x) \end{aligned} \quad (29)$$

Then we rewrite the covariant derivative term by the fields  $h(x)$  and  $\phi(x)$ :

$$\begin{aligned} |D_\mu\Phi|^2 &= \frac{1}{2}(\partial_\mu h - eA_\mu\phi)^2 + \frac{1}{2}(\partial_\mu\phi + eA_\mu(v+h))^2 = \\ &\frac{1}{2}[(\partial_\mu h)^2 + (\partial_\mu\phi)^2 + e^2v^2A_\mu A^\mu + 2evA^\mu\partial_\mu\phi(x) \\ &\quad - 2e\phi(x)A^\mu(x)\partial_\mu h(x) + 2eh(x)A^\mu\partial_\mu\phi(x) \\ &\quad e^2(2vh(x) + h^2(x) + \phi^2(x))A_\mu A^\mu] \end{aligned} \quad (30)$$

The gauge transformations take the form

$$\delta h = -\alpha(x)h, \quad \delta\phi = \alpha(x)(v+h), \quad \delta A_\mu = -\frac{1}{e}\partial_\mu\alpha(x) \quad (31)$$

## 2.2. Paths integral and t'Hooft's gauge fixing.

Now we are interested in the paths integral

$$\begin{aligned} Z &= \int [DA][Dh][D\phi] \exp [i \int d^4x L(A, h, \phi)] = \\ &C \int [DA][Dh][D\phi] \exp [i \int d^4x L(A, h, \phi)] \det\left(\frac{\delta G}{\delta\alpha}\right) \delta(G(A, h, \phi)) \end{aligned} \quad (32)$$

where the gauge fixing has been introduced by a function  $G(A, h, \phi) = 0$  and the result of integration over the gauge transformation orbits has been

taken into account by the factor  $C$ . One also can change the gauge fixing conditions by a more general ones

$$G(A, h, \phi) = 0 \rightarrow G(A, h, \phi) - \omega(x) = 0 \quad (33)$$

and integrate out over all possible functions  $\omega(x)$  weighted by  $\exp[-\imath \int d^4x \frac{\omega(x)^2}{2\xi}]$ :

$$\begin{aligned} & N(\xi) \int [DA][Dh][D\phi][D\omega] \exp[-\imath \int d^4x \frac{\omega(x)^2}{2\xi}] \\ & \exp[\imath \int d^4x L(A, h, \phi)] \det\left(\frac{\delta G}{\delta \alpha}\right) \delta(G(A, h, \phi) - \omega) = \\ & N(\xi) \int [DA][Dh][D\phi] \exp[\imath \int d^4x (L(A, h, \phi) - \frac{1}{2\xi} G^2)] \det\left(\frac{\delta G}{\delta \alpha}\right) \end{aligned} \quad (34)$$

In what follows we redefine  $\frac{G^2}{\xi} \rightarrow G^2$ .

There is a good choice of  $G$ :

$$G = \frac{1}{\sqrt{\xi}}(\partial_\mu A^\mu - \xi ev\phi) \quad (35)$$

**Notice that gauge condition depends on the Goldstone field** Then

$$\begin{aligned} & L(A, h, \phi) - \frac{1}{2}G^2 = \\ & \frac{1}{2}A_\mu [g^{\mu\nu}(\partial)^2 + (\frac{1}{\xi} - 1)\partial^\mu\partial^\nu + (ev)^2]A_\nu \\ & + \frac{1}{2}(\partial_\mu h)^2 - \frac{1}{2}2\mu^2 h^2 + \frac{1}{2}(\partial_\mu \phi)^2 - \frac{\xi}{2}(ev)^2\phi^2 \\ & - e\phi A_\mu \partial^\mu h + eh A_\mu \partial^\mu \phi + \frac{e^2}{2}(2vh + h^2 + \phi^2)A_\mu A^\mu + \\ & \frac{\mu^2}{2\lambda} - \frac{\lambda}{8}(4v + h)h^3 - \frac{\lambda}{4}(2v + h)h\phi^2 - \frac{\lambda}{8}\phi^4 = \\ & \frac{1}{2}A_\mu [g^{\mu\nu}(\partial)^2 + (\frac{1}{\xi} - 1)\partial^\mu\partial^\nu + (ev)^2]A_\nu \\ & + \frac{1}{2}(\partial_\mu h)^2 - \frac{1}{2}2\mu^2 h^2 + \frac{1}{2}(\partial_\mu \phi)^2 - \frac{\xi}{2}(ev)^2\phi^2 + \dots \end{aligned} \quad (36)$$

**We see that  $G^2$  term contains the old gauge fixing condition  $(\partial^\mu A_\mu)^2$ .**

The cross term in  $G^2$  is engineered to cancel the term  $A^\mu \partial_\mu \phi$  term in the Lagrangian (??).

One can see also that the Higgs field  $h$ , get mass  $m_h^2 = 2\mu^2$  from the expansion of  $V$  around minimum.

The gauge boson  $A_\mu$  get mass  $m_A^2 = (ev)^2$  from the Higgs effect.

Notice also that Goldstone boson  $\phi$  get the mass  $\xi(ev)^2$ , but this mass depends on gauge fixing. This should hint to us that **Goldstone field is unphysical (fictitious)**. Indeed, due to inhomogeneous term in the gauge transformation rule (??) of  $\phi$ , one can get rid this field.

Now one needs to introduce Faddeev-Popov ghosts calculating  $\frac{\delta G}{\delta \alpha}$ :

$$\begin{aligned} \frac{\delta G}{\delta \alpha} &= \frac{1}{\sqrt{\xi}} \left( -\frac{1}{e} (\partial)^2 - \xi ev(v+h) \right) \Rightarrow \\ & \det \left( \frac{\delta G}{\delta \alpha} \right) = \\ & \int [Dc][D\bar{c}] \exp \left[ -i \int d^4x \bar{c}(x) \frac{1}{e\sqrt{\xi}} \left( -(\partial)^2 - \xi m_A^2 \left( 1 + \frac{h}{v} \right) \right) c(x) \right] \quad (37) \end{aligned}$$

Note that although we are dealing with an abelian gauge theory the ghosts fields can not be ignored because of they interact to the Higgs field.

### 2.3. Propagators and their poles.

Now we can extract the propagators for all the fields from (??), (??).

The propagator for  $A_\mu(x)$  is the inverse to the operator

$$g^{\mu\nu} k^2 - \left( 1 - \frac{1}{\xi} \right) k^\mu k^\nu - m_A^2 g^{\mu\nu} = g^{\mu\nu} (k^2 - m_A^2) - \left( 1 - \frac{1}{\xi} \right) k^\mu k^\nu \quad (38)$$

Hence

$$\begin{aligned} \langle A_\nu(k) A_\lambda(-k) \rangle &= \frac{-i}{k^2 - m_A^2} \left( g_{\nu\lambda} - (1 - \xi) \frac{k_\nu k_\lambda}{k^2 - \xi m_A^2} \right) = \\ & \frac{-i}{k^2 - m_A^2} \left( g_{\nu\lambda} - \frac{k_\nu k_\lambda}{m_A^2} \right) + \frac{-i k_\nu k_\lambda}{m_A^2 (k^2 - \xi m_A^2)} \quad (39) \end{aligned}$$

Thus, we are almost back to the progatator (??).

Propagator for Higgs field is

$$\langle h(k)h(-k) \rangle = \frac{i}{k^2 - m_h^2} \quad (40)$$

Propagator for Goldstone field is

$$\langle \phi(k)\phi(-k) \rangle = \frac{i}{k^2 - \xi m_A^2} \quad (41)$$

Propagator for ghosts  $c$  field is

$$\langle c(k)c(-k) \rangle = \frac{i}{k^2 - \xi m_A^2} \quad (42)$$

**We see that poles for propagators  $A_\mu$  and Goldstone  $\phi$  are at the same place.** It will lead to cancellations in all physical amplitudes in such a way that the result will not be dependent on  $\xi$ .

In other words, **one can show that Green's functions and  $S$ -matrix of gauge invariant operators will not depend on  $\xi$ .**

This statement can be proved by BRST symmetry but we will show this in some particular example.

#### *2.4. Renormalizability and unitarity.*

Using the freedom to choose the value of  $\xi$  one can make two important observations.

##### **1. $\xi = 0$ .**

In this case all the propagators fall as  $\frac{1}{k^2}$ . So that one can apply the standard analysis of diagrams divergences to conclude that **the theory is renormalizable.**

##### **2. $\xi = \infty$ .**

Then

$$\begin{aligned} \langle A_\nu(k)A_\lambda(-k) \rangle &= \frac{-i}{k^2 - m_A^2} \left( g_{\nu\lambda} - \frac{k_\nu k_\lambda}{m_A^2} \right) \\ &\langle \phi(k)\phi(-k) \rangle = 0 \\ &\langle c(k)c(-k) \rangle = 0 \end{aligned} \quad (43)$$

Thus, the unphysical fields  $\phi$  and  $c$  does not propagate. At the same time, the gauge field has on mass-shell only 3 space-like polarizations. Indeed, the tensor part of the propagator for  $A_\mu$  is given by the sum over the polarizations:

$$\sum_{\epsilon \perp k} \epsilon^\nu \epsilon_\mu = \delta_\mu^\nu - \frac{k^\nu k_\mu}{m_A^2} \quad (44)$$

But in the own reference system of vector particle the right hand side of (??) is nothing else but the projection operator on the space-like directions.

**Hence, the theory is unitary.**

### 2.5. Higgs effect for fermions.

Now we are going to demonstrate  $\xi$ -independence of amplitudes by an example.

Let us add the massless fermions and consider the Lagrangian

$$\begin{aligned} L(A, h, \phi, \psi) &= L(A, h, \phi) + \\ &\bar{\psi}_L(\imath\gamma^\mu D_\mu)\psi_L + \bar{\psi}_R(\imath\gamma^\mu \partial_\mu)\psi_R - \lambda_f(\bar{\psi}_L\Phi\psi_R + \bar{\psi}_R\Phi^*\psi_L), \\ D_\mu &= \partial_\mu + \imath e A_\mu \end{aligned} \quad (45)$$

The gauge transformations for fermions are given by

$$\psi_L \rightarrow \exp(\imath\alpha(x))\psi_L, \quad \psi_R \rightarrow \psi_R \quad (46)$$

**Notice that the left-chiral fermions  $\psi_L(x)$  and right-chiral fermions  $\psi_R(x)$  have different gauge transformation rules.** The right-chiral fermions are singlets w.r.t. the gauge group  $U(1)$  so they do not interact with the EM field, while the left-chiral fermions transform by the standard rules so that they interact to EM field. This left-right asymmetry is similar to that in the Standard Model of electro-weak interactions. At the same time the fermions interact with the complex scalar field in such a way

to conserve the gauge invariance and get the masses by the Higgs mechanism. Thus, **the Lagrangian (??) is similar to the Standard-Model Lagrangian.**

To see the Higgs effect for fermions we rewrite the interaction terms using the left-right chirality projectors  $\frac{1\pm\gamma^5}{2}$ :

$$\begin{aligned}
& \lambda_f(\bar{\psi}_L\Phi\psi_R + \bar{\psi}_R\Phi^*\psi_L) = \\
& \lambda_f(\Phi\bar{\psi}\frac{1+\gamma^5}{2}\psi + \Phi^*\bar{\psi}\frac{1-\gamma^5}{2}\psi) = \\
& \frac{\lambda_f}{\sqrt{2}}((v+h(x)+i\phi(x))\bar{\psi}\frac{1+\gamma^5}{2}\psi + \\
& (v+h(x)-i\phi(x))\bar{\psi}\frac{1-\gamma^5}{2}\psi) = \\
& \frac{\lambda_f}{\sqrt{2}}((v+h(x))\bar{\psi}\psi + i\phi(x)\bar{\psi}\gamma^5\psi) = \\
& m_f\bar{\psi}\psi + \frac{\lambda_f}{\sqrt{2}}(h(x)\bar{\psi}\psi + i\phi(x)\bar{\psi}\gamma^5\psi), \\
& m_f = \frac{\lambda_f v}{\sqrt{2}}
\end{aligned} \tag{47}$$

Thus, the fermions become massive.

### 2.6. Green's functions do not depend on gauge fixing: Example.

We want to calculate main contribution to the fermion-fermion scattering amplitude in this theory. It is given by three diagrams:

$$\tag{48}$$

In the first diagram the fermions exchange by the gauge field  $A_\mu$ . Ac-

According to the Feynmann rules this amplitude is given by

$$\begin{aligned}
iM_A &= (-ie)^2 \bar{u}(p_2) \gamma_\mu \frac{1 - \gamma^5}{2} u(p_1) \\
&\frac{-i}{q^2 - m_A^2} (g^{\mu\nu} - (1 - \xi) \frac{q^\mu q^\nu}{q^2 - \xi m_A^2}) \bar{u}(k_2) \gamma_\nu \frac{1 - \gamma^5}{2} u(k_1) = \\
&(-ie)^2 \bar{u}(p_2) \gamma_\mu \frac{1 - \gamma^5}{2} u(p_1) \\
&(\frac{-i}{q^2 - m_A^2} (g^{\mu\nu} - \frac{q^\mu q^\nu}{m_A^2}) + \frac{-i q^\mu q^\nu}{m_A^2 (q^2 - \xi m_A^2)}) \bar{u}(k_2) \gamma_\nu \frac{1 - \gamma^5}{2} u(k_1) = \\
&(-ie)^2 \bar{u}(p_2) \gamma_\mu \frac{1 - \gamma^5}{2} u(p_1) \frac{-i}{q^2 - m_A^2} (g^{\mu\nu} - \frac{q^\mu q^\nu}{m_A^2}) \bar{u}(k_2) \gamma_\nu \frac{1 - \gamma^5}{2} u(k_1) + \\
&(-ie)^2 \bar{u}(p_2) \gamma_\mu \frac{1 - \gamma^5}{2} u(p_1) \frac{-i q^\mu q^\nu}{m_A^2 (q^2 - \xi m_A^2)} \bar{u}(k_2) \gamma_\nu \frac{1 - \gamma^5}{2} u(k_1) \quad (49)
\end{aligned}$$

Now we rewrite the second term using the momentum conservation law  $q = p_1 - p_2$  and Dirac equation of motion  $p^\mu \gamma_\mu u(p) = m_f u(p)$ :

$$\begin{aligned}
&\bar{u}(p_2) q^\mu \gamma_\mu \frac{1 - \gamma^5}{2} u(p_1) = \\
&\frac{1}{2} \bar{u}(p_2) ((p_1 - p_2)^\mu \gamma_\mu - (p_1 - p_2)^\mu \gamma_\mu \gamma^5) u(p_1) = \\
&\frac{1}{2} \bar{u}(p_2) (p_1 - p_2)^\mu \gamma_\mu u(p_1) + \frac{1}{2} \bar{u}(p_2) (\gamma^5 \gamma^\mu (p_1)_\mu + (p_2)_\mu \gamma^\mu \gamma^5) u(p_1) = \\
&\frac{1}{2} \bar{u}(p_2) (m_f - m_f) u(p_1) + \\
&\frac{1}{2} \bar{u}(p_2) (m_f \gamma^5 + m_f \gamma^5) u(p_1) = \\
&m_f \bar{u}(p_2) \gamma^5 u(p_1) \quad (50)
\end{aligned}$$

Hence, the amplitude takes the form

$$\begin{aligned}
&(-ie)^2 \bar{u}(p_2) \gamma_\mu \frac{1 - \gamma^5}{2} u(p_1) \frac{-i}{q^2 - m_A^2} (g^{\mu\nu} - \frac{q^\mu q^\nu}{m_A^2}) \bar{u}(k_2) \gamma_\nu \frac{1 - \gamma^5}{2} u(k_1) + \\
&\frac{\lambda_f^2}{2} \bar{u}(p_2) \gamma^5 u(p_1) \frac{-i}{q^2 - \xi m_A^2} \bar{u}(k_2) \gamma^5 u(k_1) \quad (51)
\end{aligned}$$

In the second diagram the fermions exchange by the Goldstone field  $\phi$ .

According to the Feinmann rules this amplitude is given by

$$iM_\phi = \frac{\lambda_f^2}{2} \bar{u}(p_2) \gamma^5 u(p_1) \frac{i}{q^2 - \xi m_A^2} \bar{u}(k_2) \gamma^5 u(k_1) \quad (52)$$

Therefore

$$iM_A + iM_\phi = (-ie)^2 \bar{u}(p_2) \gamma_\mu \frac{1 - \gamma^5}{2} u(p_1) \frac{-i}{q^2 - m_A^2} (g^{\mu\nu} - \frac{q^\mu q^\nu}{m_A^2}) \bar{u}(k_2) \gamma_\nu \frac{1 - \gamma^5}{2} u(k_1) \quad (53)$$

so the result does not depend on  $\xi$ .

In the third diagram the fermions exchange by the Higgs field  $h$  so this amplitude does not depend on  $\xi$ . Thus **we have shown the  $\xi$ -dependent contributions mutual cancellation in the total fermion scattering amplitude.**

## Appendix A. Ward identity for polarization operator in QED.

Let us consider the correlation function

$$I[J^\nu(y)] = \int [DA][D\psi][D\bar{\psi}] e\bar{\psi}(y) \gamma^\nu \psi(y) \exp [i \int d^4x L_{QED}] \quad (54)$$

Because of the measure  $[D\psi][D\bar{\psi}]$  in (??) is invariant under the changes of variables

$$\psi(x) \rightarrow \acute{\psi} = \psi(x) + ie\alpha(x)\psi(x), \quad \bar{\psi}(x) \rightarrow \acute{\bar{\psi}}(x) = \bar{\psi}(x) - ie\alpha(x)\bar{\psi}(x) \quad (55)$$

where  $\alpha(x)$  is a small variation and the current is also invariant

$$\bar{\psi}(y) \gamma^\nu \psi(y) \rightarrow \acute{\bar{\psi}}(y) \gamma^\nu \acute{\psi}(y) \quad (56)$$

the paths integral (??) is unchanged:

$$\int [DA][D\psi][D\bar{\psi}] e\bar{\psi}(y) \gamma^\nu \psi(y) \exp [i \int d^4x L_{QED}] = \int [DA][D\acute{\psi}][D\acute{\bar{\psi}}] e\acute{\bar{\psi}}(y) \gamma^\nu \acute{\psi}(y) \exp [i \int d^4x L_{QED}] \quad (57)$$

From the other hand  $L_{QED} \rightarrow L_{QED} - e(\partial_\mu \alpha)(x)\bar{\psi}(x)\gamma^\mu\psi(x)$ , therefore

$$\begin{aligned}
& 0 = \delta_\alpha I[J^\nu] = \\
& \int [DA][D\psi][D\bar{\psi}] (-i \int d^4x \partial_\mu \alpha(x) J^\mu(x) J^\nu(y)) \exp [i \int d^4u L_{QED}] \Rightarrow \\
& \frac{\delta_\alpha I[J^\nu]}{Z} = i \partial_\mu \langle \Omega | T J^\mu(x) J^\nu(y) | \Omega \rangle = 0 \quad (58)
\end{aligned}$$

Then making the Fourier transform and taken into account the translation invariance the identity (??) takes the form

$$\begin{aligned}
& k_\mu P^{\mu\nu}(k) = \delta(k_1 + k_2) k_{1\mu} P^{\mu\nu}(k_1, k_2) = \\
& \int d^4x d^4y (k_1)_\mu \exp [-i(k_1x + k_2y)] \langle \Omega | T J^\mu(x) J^\nu(y) | \Omega \rangle = \\
& i \int d^4x d^4y \left( \frac{\partial}{\partial x^\mu} \exp [-i(k_1x + k_2y)] \right) \langle \Omega | T J^\mu(x) J^\nu(y) | \Omega \rangle = \\
& -i \int d^4x d^4y \exp [-i(k_1x + k_2y)] \frac{\partial}{\partial x^\mu} \langle \Omega | T J^\mu(x) J^\nu(y) | \Omega \rangle = 0 \quad (59)
\end{aligned}$$

Or

$$\begin{aligned}
& \partial_\mu \langle \Omega | T J^\mu(x) J^\nu(y) | \Omega \rangle = \\
& \int d^4k_1 d^4k_2 i (k_1)_\mu P^{\mu\nu}(k_1, k_2) \exp [ik_1x + ik_2y] = 0 \quad (60)
\end{aligned}$$
